

A venue operator implements the instant invention for his use as his own ticketing and reservation system.

- 2. That specific venue is recorded, coded and placed on a server connected conventionally to the internet or any such wide area network.
- 3. A prospective customer for tickets to any some event logs onto the internet, or other such wide area network, in his conventional manner, whether from home or office or any remote location.
- 4. Said prospective customer attaches to the server through any conventional graphical browsing means and views the available venues, performances, dates, and/or other such offerings.
- 6. Said prospective customer selects a specific area of interest from the available venues. Such may be theater tickets for a particular show date, airline seats for a given flight, etc., and indicates his selection through a conventional hyperlink or other compatible means.
- 5. Upon first access an inquiry is made to the appropriate database asking for a return to the prospective customer of all generalized information available from which he will make a selection of the type of venue he is seeking.
- 7. Upon contact the server makes another appropriate database query asking for a return to the prospective customer of all specific information relating to his selection, i.e., available seats for the chosen airline flight, from which he will make his selection or
- 8. Upon return the prospective customer is presented with a representation of all available seating for his selected venue. From this representation, which may be graphical or displayed in any other appropriate way, he makes a selection of the specific seat or seats he wishes to reserve and submits such to the server.
- 10. The server requests payment information from the now customer through a form input mechanism. Once completed and submitted customers payment information is verified through conventional means with any of the existing processing means.
- 9. The server creates a temporary customer identification and associates the prospective customers selections with that specific identification so as to preclude confusion and allow multiple simultaneous users.
- 11(A). If customer's payment information verification is successful then:
- (a) the customers information, as supplied in Step 10, is made permanent and;
- (b) those specific seats as selected by the customer are removed from available inventory and;
- (c) marked as unavailable on the graphical representation of the venue seating as presented to the next prospective customer;
- (d) entered into the accounting and administration information database for later retrieval by the venue operator..

- 11(B). If customers payment information verification is not successful then:
- (a) customer is given the opportunity to correct his submittal and try again;
- (b) customer can return to the beginning and repeat the entire process.
 - 12. A confirmation of the transaction, containing the transaction identification and other pertinent information is returned to the customer

This is primarily --- > <REM --- for security purposes as the instanced "reserved" is only ---> <REM --- called in the step immediately before. If a visitor <REM --- accidentally stumbled upon this file, nothing will be run --- > <REM --- unless all previous steps are completed. <iCASE ALIAS="reserve" VALUE="receipt"> <CENTER> <TABLE BGCOLOR='#000000' BORDER=0 CELLPADDING=5 CELLSPACING=0 WIDTH=500> <TR><TD> <CENTER> **Concert Reservation System** </CENTER> </TD></TR> </TABLE> </CENTER> <REM --- Two steps are combined here: <REM --- 1. The reservation information captured in <REM --- "reserve2.ihtml" is passed to the iPAY tag which

XVII

```
<REM --- processes the information and passes it to CyberCash --->
<REM --- for verification. If successful, the tag returns
<REM --- "success", otherwise it returns a variation of "fail" --- >
<REM --- 2. iIF checks to see if the verification is a success or --- >
<REM --- failure. If successful, it will process the codes
<REM --- immediately after it, which includes updating the
<REM --- database with a successful reservation. If anything --- >
<REM --- other than "success" is returned, ilF will skip to
<REM --- the iELSE tag and execute all codes thereafter.
